AAMT is the nation’s premier organisation of mathematics educators: supporting and enhancing the work of teachers; promoting the learning of mathematics; representing and promoting interests in mathematics education.
CONTENTS

Contents...........................................................................................................................................................................i
Foreword ..............................................................................................................................................................................ii
More than fifty years of Unifix®...........................................................................................................................................iii
A guide to using Unifix® materials in the classroom.............................................................................................................iv
Challenging the step-by-step approach .................................................................................................................................v
Introducing Learning Centres ................................................................................................................................................vi
Towards mathematical abstraction ..............................................................................................................................................vii
Becoming familiar with Unifix®...............................................................................................................................................2-3
Listening skills are important..................................................................................................................................................4-5
Blocks in socks.........................................................................................................................................................................6-9

Pattern..................................................................................................................................................................................10-35
Snap-clap................................................................................................................................................................................12-13
Making long train....................................................................................................................................................................14-15
Repeating patterns.................................................................................................................................................................16-17
Growing patterns....................................................................................................................................................................18-19
Carriages in the train shed ......................................................................................................................................................20-27
Unifix® stack...........................................................................................................................................................................28-29
Snakes....................................................................................................................................................................................30-31
Unifix® pattern using playing cards.....................................................................................................................................32-33
Number patterns......................................................................................................................................................................34-35

Precise calculations..................................................................................................................................................................36-47
True or false on your fingers...................................................................................................................................................38-39
Adding numbers in pictures....................................................................................................................................................40
Adding values, cards...............................................................................................................................................................41
A fleet of ships..........................................................................................................................................................................42
The best..................................................................................................................................................................................43

Measure the stick.....................................................................................................................................................................44-47

Trading games & beyond.......................................................................................................................................................48-76
Trading cards on card land and its money system..................................................................................................................50-51
Understanding money game....................................................................................................................................................52-53
Trading cards on trading boards...........................................................................................................................................54-55
Trading cards and tax game.....................................................................................................................................................56-57
Hawaii 3-0.................................................................................................................................................................................58-59
It's tax time in Hawaii 3-0.......................................................................................................................................................60
Hawaii 3-0 trading board........................................................................................................................................................61
Tens land................................................................................................................................................................................62-63
Discovering 1 to 100 with an operational grid......................................................................................................................64-65
Discovering 1 to 100 on a 100 track.......................................................................................................................................66-67
The 1 to 100 experience.........................................................................................................................................................68-69
Addition and subtraction..........................................................................................................................................................70-71
Composing and decomposing...............................................................................................................................................72-73
Link and detach......................................................................................................................................................................74-75
Complete the wall....................................................................................................................................................................76

The name game.....................................................................................................................................................................77
Building a graph.....................................................................................................................................................................78-79

Glossary................................................................................................................................................................................80
Unifix® materials.....................................................................................................................................................................81
Purpose
To develop the concepts of more and less.
To use the language associated with comparing sets of objects (blocks).
To develop simple addition and subtraction concepts.

Knowing the language
While many of the activities appear quite simple, the language required to understand the idea is relatively sophisticated. Many mathematical errors occur because students do not comprehend or misunderstand the wording involved.

(When trying these activities with young students, one claimed to have 'misunderstood' the instructions.)

When giving specific instructions—such as those used in this activity—watch for students who 'misunderstand'. If the students give you a blank look it is likely that they are unfamiliar with the language being used. Model the correct language. Write the words on the board or card for the students to see.

Examples of misunderstood words include:
- pile
- heap
- collection
- stack
- join
- connect
- colours (see list page 2)
- tall
- short
- corner
- sideways
- sorted
- bundled
- piled
- placed
- long
- shorter
- longest
- shortest
- taller
- shorter
- highest
- lowest

Collect a few brightly coloured (coloured) socks.

Focus the students’ attention on the collection of coloured socks. Ask the students to name the colours.

Empty each sock and stack the blocks on top.

Ask the students whether their classmate was correct. Why?

Encourage discussion and then the chart 'Most blocks in socks - (sock colour)'. When you have discovered the least number of blocks in a sock 'Least blocks in socks - (sock colour)'.

Continue the game until the students grasp the idea.
Three blocks on your fingers

What is hidden in the digit ‘3’?

Already, you will have completed quite a lot of informal counting with some of the pattern-making activities. At this stage, all the counting activity will be oral; the ‘symbolic’ digits will be introduced shortly.

Playing with ‘threes’

Working with the whole group, count out three blocks of the same colour.

‘one’

‘two’

‘three’

I have a group of three blocks.’

‘Here is a group of three blocks.’

‘Six’

‘Ten’

‘Thirteen’

‘Show me a group of three blocks.’

You might need to count the entire triplet or side by side to point out that it is a group.

Is that a problem? Not as long as the student is aware that he/she is working to a definable target. Students may be given one line of blocks from left to right.

The class now count out three different coloured blocks with the teacher. Ask the students ‘Are any of the blocks the same?’ ‘No.’

Now count out three blocks, with two blocks the same colour. Ask the students:

‘How many blocks altogether?’

‘Three.’

‘How many blocks are the same?’

‘Two.’

Make two groups of three blocks and ask the class ‘How many blocks altogether?’ Repeat this challenge with more blocks.

Guidelines for using this photocopiable resource

Make a copy of all the sections, three on a page, on a photocopiable master on the back page.

Three blocks on your fingers

Arrange the students in groups of four to six. Ensure that each group has an adequate pile of blocks. Instruct the students to find three blocks of the same colour then arrange them on the fingers of one hand, so that no-one else in the group can see the same arrangement.

The students will take time to sort themselves out. Move from group to group offering help and advice to solve the problem, not answer it. Here are a few possibilities.

How would you respond if a student showed one of these solutions?

I hope you would challenge the student; just as you would any other: ‘Tell me about yours, please.’

‘How many “threes on fingertips” would there be if colour mattered?’

‘Lots!’

Purpose

Any number, in this case three, can be represented in many different ways.

Developing a picture of three

Within this activity is an amazing idea for young students to grasp: every ‘picture’ of three is different, yet every one of them can be called ‘three’ and, later, symbolised by ‘3’.

The finger game does not work well when four blocks are used, but adaptations of the idea may be created.

Remember! At this stage we have had only language to share ideas. Now is the time to move to the E stage of DTE; E means ‘explain’ and this can mean ‘students write, draw, model the idea any way they wish’.

This is an important stage before we move on to formally introducing the digits. If the students write formal responses do not be concerned. Check to make sure the student knows what he/she is doing, and, if he/she does, celebrate with the student, not the class. One of the problems is the tendency for students to copy another student’s ideas. We need to check to make sure the student knows what is happening, but never challenge a student directly for copying.
